This pdf can be worthy of a study, and a lot better than other. I am quite late in start reading this one, but better then never. You wont truly feel monotony at at any moment of your respective time (that's what catalogues are for regarding in the event you check with me).

DIFFERENTIAL EQUATIONS MATHEMATICAL MONOGRAPHS VOLUME 9

IT is customary to divide the Infinitesimal Calculus, or Calculus of Continuous Functions, into three parts, under the heads Differential Calculus, Integral Calculus, and Differential Equations. The first corresponds, in the language of Newton, to the direct method of tangents, the other two to the inverse method of tangents; while the questions which come under this last head he further divided into those involving the two fluxions and one fluent, and those involving the fluxions and both fluents. On account of the inverse character which thus attaches to the present subject, the differential equation must necessarily at first be viewed in connection with a primitive, from which it might have been obtained by the direct process, and the solution consists in the discovery, by tentative and more or less artificial methods, of such a primitive, when it exists; that is to say, when it is expressible in the elementary functions which constitute the original field with which the Differential Calculus has to do. It is the nature of an inverse process to enlarge the field of its operations, and the present is no exception; but the adequate handling of the new functions with which the field is thus enlarged requires the introduction of the complex variable, and is beyond the scope of a work of this size. But the theory of the nature and meaning of a differential equation between real variables possesses a great deal of interest. To this part of the subject I have endeavored to give a full treatment by means of extensive use of graphic representations in rectangular coordinates. If we ask what it is that satisfies an ordinary differential equation of the first...
